

Automated Outreach Pipeline

Final Deployment Report

Generated: 2026-06-08 09:45 IST

The project has been pushed to GitHub and deployed to Vercel. The live deployment has been verified for the root route, health check, and Swagger documentation.

Item	Result
GitHub repository	https://github.com/sm5963397-sjm/automated-outreach-pipeline
Current branch	main
Latest commit	2beeeb7 Make file logging optional on serverless
Production API	https://automated-outreach-pipeline.vercel.app
Swagger docs	https://automated-outreach-pipeline.vercel.app/docs
Health check	https://automated-outreach-pipeline.vercel.app/health
Verification	Root route returned project status; /health returned {"status":"ok"}; /docs returned HTTP 200.

What Is Complete

- Complete source code for FastAPI, Typer CLI, SQLAlchemy repositories, Alembic migration, Celery tasks, Redis caching, provider adapters, and workflow orchestration.
- Dockerfile and docker-compose.yml for app, worker, PostgreSQL, and Redis.
- Structured JSON logging with serverless-safe stdout fallback.
- Test suite with 19 passing tests and 86.20% coverage from local verification.
- GitHub push completed to the provided repository.
- Vercel API/docs deployment completed and verified live.

Important Production Notes

- The Vercel deployment is a serverless FastAPI API/docs deployment. It does not run the long-lived Celery worker.
- Full campaign execution requires production PostgreSQL, Redis, a Celery worker host, and environment variables for Ocean, Prospeo, Eazyreach, OpenAI, and Brevo.
- Brevo sender domain setup is still required before sending real outreach: SPF, DKIM, DMARC, verified sender, and warm-up.
- Endpoints that require the database or queue will need DATABASE_URL, REDIS_URL, CELERY_BROKER_URL, and CELERY_RESULT_BACKEND configured in the hosting environment.

Recommended Next Step

For a true production deployment of the whole system, run the Docker Compose stack on a platform that supports persistent services and workers, such as Render, Railway, Fly.io, AWS ECS, or a VPS. Keep Vercel for API documentation/demo if desired, or point Vercel to an external backend service.
